

ISP1520

Hi-Speed Universal Serial Bus hub controller

Rev. 03 — 24 November 2004

Product data

1. General description

The ISP1520 is a stand-alone Universal Serial Bus (USB) hub controller IC that complies with *Universal Serial Bus Specification Rev. 2.0*. It supports data transfer at high-speed (480 Mbit/s), full-speed (12 Mbit/s) and low-speed (1.5 Mbit/s).

The upstream facing port can be connected to a Hi-Speed USB host or hub or to an Original USB host or hub. If the upstream facing port is connected to a Hi-Speed USB host or hub, then the ISP1520 will operate as a Hi-Speed USB hub. That is, it will support high-speed, full-speed and low-speed devices connected to its downstream facing ports. If the upstream facing port is connected to an Original USB host or hub, then the ISP1520 will operate as an Original USB hub. That is, high-speed devices that are connected to its downstream facing ports will operate in full-speed mode instead.

The ISP1520 is a full hardware USB hub controller. All Original USB devices connected to the downstream facing ports are handled using a single Transaction Translator (TT), when operating in a cross-version environment. This allows the whole 480 Mbit/s upstream bandwidth to be shared by all the Original USB devices on its downstream facing ports.

The ISP1520 has four downstream facing ports. If not used, ports 3 and 4 can be disabled. The vendor ID, product ID and string descriptors on the hub are supplied by the internal ROM; they can also be supplied by an external I²C-bus™ EEPROM or a microcontroller.

The ISP1520 IC is suitable for self-powered hub designs.

An analog overcurrent detection circuitry is built into the ISP1520, which can also accept digital overcurrent signals from external circuits; for example, Micrel MOSFET switch MIC2026. The circuitry can be configured to trip on a global or an individual overcurrent condition.

Each port comes with two status indicator LEDs.

Target applications of the ISP1520 are monitor hubs, docking stations for notebooks, internal USB hub for motherboards, hub for extending Intel® Easy PCs, hub boxes, and so on.

PHILIPS

2. Features

- Complies with:
 - ◆ *Universal Serial Bus Specification Rev. 2.0*
 - ◆ Advanced Configuration and Power Interface (ACPI™), OnNow™ and USB power management requirements.
- Supports data transfer at high-speed (480 Mbit/s), full-speed (12 Mbit/s) and low-speed (1.5 Mbit/s)
- Self-powered capability
- USB suspend mode support
- Configurable number of ports
- Internal power-on reset and low voltage reset circuit
- Port status indicators
- Integrates high performance USB interface device with hub handler, Philips Serial Interface Engine (SIE) and transceivers
- Built-in overcurrent detection circuit
- Individual or ganged power switching, individual or global overcurrent protection, and non-removable port support by I/O pins configuration
- Simple I²C-bus (master/slave) interface to read device descriptor parameters, language ID, manufacturer ID, product ID, serial number ID and string descriptors from a dedicated external EEPROM, or to allow the microcontroller to set up hub descriptors
- Visual USB traffic monitoring (GoodLink™) for the upstream facing port
- Uses 12 MHz crystal oscillator with on-chip Phase-Locked Loop (PLL) for low ElectroMagnetic Interference (EMI)
- Supports temperature range from –40 °C to +70 °C
- Available in LQFP64 package.

3. Applications

- Monitor hubs
- Docking stations for notebooks
- Internal hub for USB motherboards
- Hub for extending Easy PCs
- Hub boxes.

4. Abbreviations

ACPI — Advanced Configuration and Power Interface

EMI — ElectroMagnetic Interference

ESD — ElectroStatic Discharge

NAK — Not AcKnowledge

PID — Packet identifier

PLL — Phase-Locked Loop

SIE — Serial Interface Engine

TT — Transaction Translator

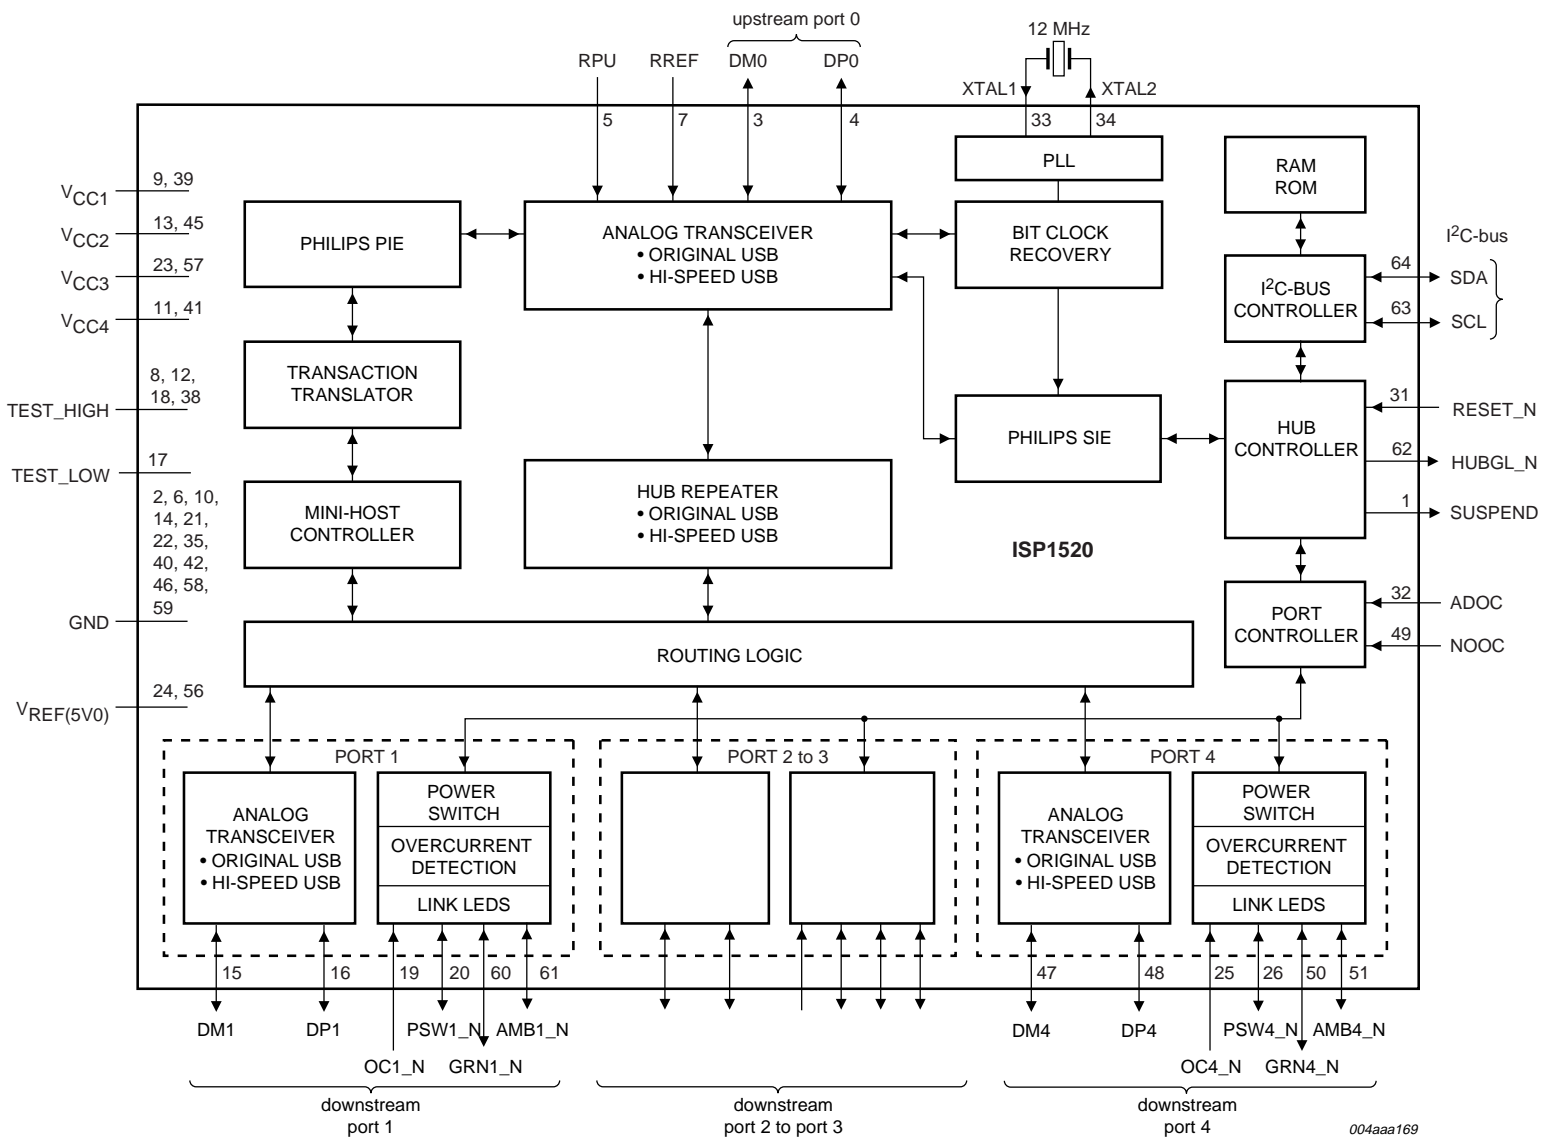

USB — Universal Serial Bus.

5. Ordering information

Table 1: Ordering information

Type number	Package		
	Name	Description	Version
ISP1520BD	LQFP64	plastic low profile quad flat package; 64 leads; body 10 × 10 × 1.4 mm	SOT314-2

6. Block diagram

004aaa169

Fig 1. Block diagram.

7. Pinning information

7.1 Pinning

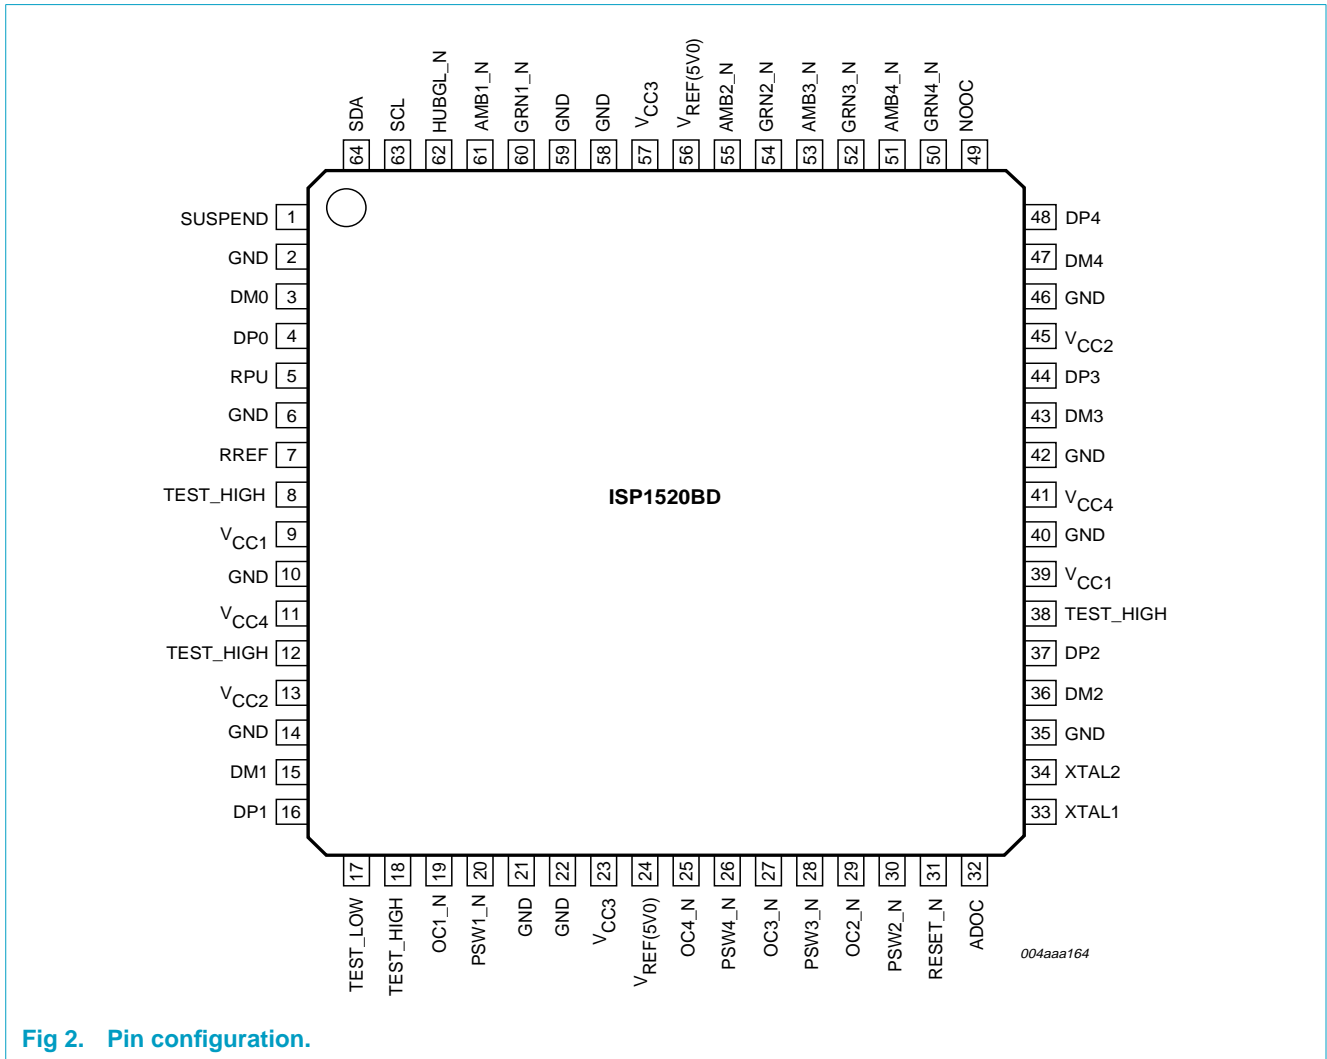

Fig 2. Pin configuration.

7.2 Pin description

Table 2: Pin description^[1]

Symbol ^[2]	Pin	Type	Description
SUSPEND	1	O	suspend indicator output; HIGH indicates that the hub is in the suspend mode
GND	2	-	ground supply
DM0	3	AI/O	upstream facing port D- connection (analog)
DP0	4	AI/O	upstream facing port D+ connection (analog)
RPU	5	AI	pull-up resistor connection; connect this pin through a resistor of 1.5 kΩ ± 5 % to 3.3 V
GND	6	-	ground supply

Table 2: Pin description^[1]...continued

Symbol ^[2]	Pin	Type	Description
RREF	7	AI	reference resistor connection; connect this pin through a resistor of $12\text{ k}\Omega \pm 1\%$ to an analog band gap ground reference
TEST_HIGH	8	-	test pin; connect to 3.3 V
V _{CC1}	9	-	analog supply voltage 1 (3.3 V)
GND	10	-	ground supply
V _{CC4}	11	-	crystal and PLL supply voltage 4 (3.3 V)
TEST_HIGH	12	-	test pin; connect to 3.3 V
V _{CC2}	13	-	transceiver supply voltage 2 (3.3 V)
GND	14	-	ground supply
DM1	15	AI/O	downstream facing port 1 D ⁻ connection (analog) ^[3]
DP1	16	AI/O	downstream facing port 1 D ⁺ connection (analog) ^[3]
TEST_LOW	17	-	connect to GND
TEST_HIGH	18	-	connect to 5.0 V through a 10 k Ω resistor
OC1_N	19	AI/I	overcurrent sense input for downstream facing port 1 (analog/digital)
PSW1_N	20	I/O	output — power switch control output (open-drain) with an internal pull-up resistor for downstream facing port 1 input — function of the pin when used as an input is given in Table 5
GND	21	-	ground supply
GND	22	-	ground supply
V _{CC3}	23	-	digital supply voltage 3 (3.3 V)
V _{REF(5V0)}	24	-	reference voltage ($5\text{ V} \pm 5\%$); used to power internal pull-up resistors of PSW _n _N pins and also for the analog overcurrent detection
OC4_N	25	AI/I	overcurrent sense input for downstream facing port 4 (analog/digital)
PSW4_N	26	I/O	output — power switch control output (open-drain) with an internal pull-up resistor for downstream facing port 4 input — function of the pin when used as an input is given in Table 5
OC3_N	27	AI/I	overcurrent sense input for downstream facing port 3 (analog/digital)
PSW3_N	28	I/O	output — power switch control output (open-drain) with an internal pull-up resistor for downstream facing port 3 input — function of the pin when used as an input is given in Table 5
OC2_N	29	AI/I	overcurrent sense input for downstream facing port 2 (analog/digital)
PSW2_N	30	I/O	output — power switch control output (open-drain) with an internal pull-up resistor for downstream facing port 2 input — function of the pin when used as an input is given in Table 5

Table 2: Pin description^[1]...continued

Symbol ^[2]	Pin	Type	Description
RESET_N	31	I	asynchronous reset input; when reset is active, the internal switch to the 1.5 kΩ external resistor is opened, and all pins DP _n and DM _n are three-state; it is recommended that you connect to V _{BUS} through an RC circuit; refer to the schematics in the <i>ISP1520 Hub Demo Board User's Guide</i>
ADOC	32	I	analog or digital overcurrent detect selection input; a LOW selects the digital mode and a HIGH (3.3 V or 5.0 V) selects the analog mode
XTAL1	33	I	crystal oscillator input (12 MHz)
XTAL2	34	O	crystal oscillator output (12 MHz)
GND	35	-	ground supply
DM2	36	AI/O	downstream facing port 2 D- connection (analog) ^[3]
DP2	37	AI/O	downstream facing port 2 D+ connection (analog) ^[3]
TEST_HIGH	38	-	test pin; connect to 3.3 V
V _{CC1}	39	-	analog supply voltage 1 (3.3 V)
GND	40	-	ground supply
V _{CC4}	41	-	crystal and PLL supply voltage 4 (3.3 V)
GND	42	-	ground supply
DM3	43	AI/O	downstream facing port 3 D- connection (analog) ^[4]
DP3	44	AI/O	downstream facing port 3 D+ connection (analog) ^[4]
V _{CC2}	45	-	transceiver supply voltage 2 (3.3 V)
GND	46	-	ground supply
DM4	47	AI/O	downstream facing port 4 D- connection (analog) ^[4]
DP4	48	AI/O	downstream facing port 4 D+ connection (analog) ^[4]
NOOC	49	I	no overcurrent protection selection input; connect this pin to HIGH (3.3 V) to select no overcurrent protection; if no overcurrent is selected, all OC _n _N pins must be connected to V _{REF(5V0)}
GRN4_N	50	I/O	output — green LED port indicator (open-drain) for downstream facing port 4 input — function of the pin when used as an input is given in Table 9
AMB4_N	51	I/O	output — amber LED port indicator (open-drain) for downstream facing port 4 input — function of the pin when used as an input is given in Table 8
GRN3_N	52	I/O	output — green LED port indicator (open-drain) for downstream facing port 3 input — function of the pin when used as an input is given in Table 9
AMB3_N	53	I/O	output — amber LED port indicator (open-drain) for downstream facing port 3 input — function of the pin when used as an input is given in Table 8

Table 2: Pin description^[1]...continued

Symbol ^[2]	Pin	Type	Description
GRN2_N	54	I/O	output — green LED port indicator (open-drain) for downstream facing port 2 input — function of the pin when used as an input is given in Table 9
AMB2_N	55	I/O	output — amber LED port indicator (open-drain) for downstream facing port 2 input — function of the pin when used as an input is given in Table 8
V _{REF(5V0)}	56	-	reference voltage (5 V ± 5 %); used to power internal pull-up resistors of PSWn_N pins and also for the analog overcurrent detection
V _{CC3}	57	-	digital supply voltage 3 (3.3 V)
GND	58	-	ground supply
GND	59	-	ground supply
GRN1_N	60	I/O	output — green LED port indicator (open-drain) for downstream facing port 1 input — function of the pin when used as an input is given in Table 9
AMB1_N	61	I/O	output — amber LED port indicator (open-drain) for downstream facing port 1 input — function of the pin when used as an input is given in Table 8
HUBGL_N	62	O	hub GoodLink LED indicator output; the LED is off until the hub is configured; a transaction between the host and the hub will blink the LED off for 100 ms; this LED is off in the suspend mode (open-drain)
SCL	63	I/O	I ² C-bus clock (open-drain); see Table 11
SDA	64	I/O	I ² C-bus data (open-drain); see Table 11

[1] The maximum current the ISP1520 can sink on a pin is 8 mA.

[2] Symbol names ending with underscore N (for example, NAME_N) represent active LOW signals.

[3] Downstream ports 1 and 2 cannot be disabled.

[4] To disable a downstream port n, connect both pins DPn and DMn to V_{CC} (3.3 V); unused ports must be disabled in reverse order starting from port 4.

8. Functional description

8.1 Analog transceivers

The integrated transceivers directly interface to USB lines. They can transmit and receive serial data at high-speed (480 Mbit/s), full-speed (12 Mbit/s) and low-speed (1.5 Mbit/s).

8.2 Hub controller core

The main components of the hub core are:

- Philips Serial Interface Engine (SIE)
- Routing logic
- Transaction Translator (TT)
- Mini-host controller
- Hub repeater
- Hub controller
- Port controller
- Bit clock recovery.

8.2.1 Philips serial interface engine

The Philips SIE implements the full USB protocol layer. It is completely hardwired for speed and needs no firmware intervention. The functions of this block include: synchronization, pattern recognition, parallel or serial conversion, bit (de-)stuffing, CRC checking and generation, Packet IDentifier verification and generation, address recognition, and handshake evaluation and generation.

8.2.2 Routing logic

The routing logic directs signaling to the appropriate modules (mini-host controller, Original USB repeater and Hi-Speed USB repeater) according to the topology in which the hub is placed.

8.2.3 Transaction translator

The TT acts as a go-between mechanism that links devices operating in the Original USB mode and the Hi-Speed USB upstream mode. For the 'IN' direction, data is concatenated in TT buffers till the proper length is reached, before the host takes the transaction. In the reverse direction (OUT), the mini-host dispenses the data contained in TT buffers over a period that fits into the Original USB bandwidth. This continues until all outgoing data is emptied. TT buffers are used only on split transactions.

8.2.4 Mini-host controller

The internal mini-host generates all the Original USB IN, OUT or SETUP tokens for the downstream facing ports, while the upstream facing port is in the high-speed mode. The responses from the Original USB devices are collected in TT buffers, until the end of the complete split transaction clears the TT buffers.

8.2.5 Hub repeater

A hub repeater is responsible for managing connectivity on a per packet basis. It implements packet signaling connectivity and resume connectivity. There are two repeaters in the ISP1520: a Hi-Speed USB repeater and an Original USB repeater. The only major difference between these two repeaters is the speed at which they operate. When the hub is connected to an Original USB system, it automatically switches itself to function as a pure Original USB hub.

8.2.6 Hub and port controllers

The hub controller provides status report. The port controller provides control for individual downstream facing port; it controls the port routing module. Any port status change will be reported to the host via the hub status change (interrupt) endpoint.

8.2.7 Bit clock recovery

The bit clock recovery circuit extracts the clock from the incoming USB data stream.

8.3 Phase-locked loop clock multiplier

A 12 MHz to 480 MHz clock multiplier PLL is integrated on-chip. This allows the use of low-cost 12 MHz crystals. The low crystal frequency also minimizes ElectroMagnetic Interference (EMI). No external components are required for the operation of the PLL.

8.4 I²C-bus controller

A simple serial I²C-bus interface is provided to transfer vendor ID, product ID and string descriptor from an external I²C-bus EEPROM (for example, Philips PCF8582 or equivalent) or microcontroller. A master/slave I²C-bus protocol is implemented according to the timing requirements as mentioned in the I²C-bus standard specifications. The maximum data count during I²C-bus transfers for the ISP1520 is 256 bytes.

8.5 Overcurrent detection circuit

An overcurrent detection circuit is integrated on-chip. The main features of this circuit are: self reporting, automatic resetting, low-trip time and low cost. This circuit offers an easy solution at no extra hardware cost on the board.

8.6 GoodLink

Indication of a good USB connection is provided through GoodLink technology. An LED can be directly connected to pin HUBGL_N via an external 330 Ω resistor.

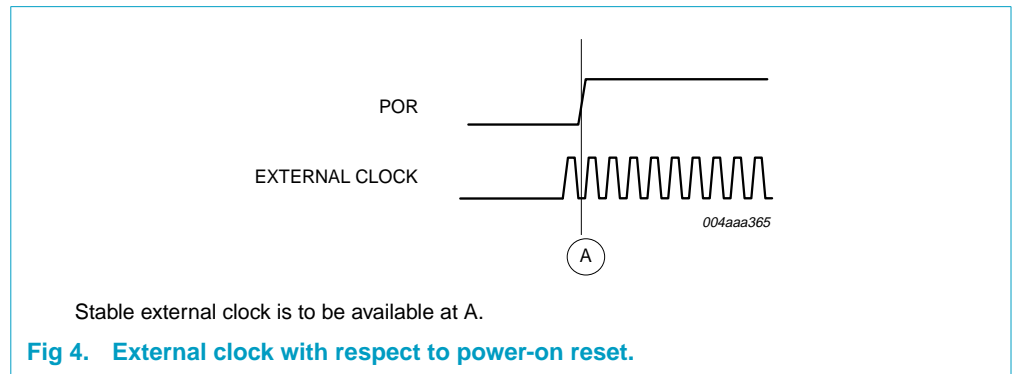

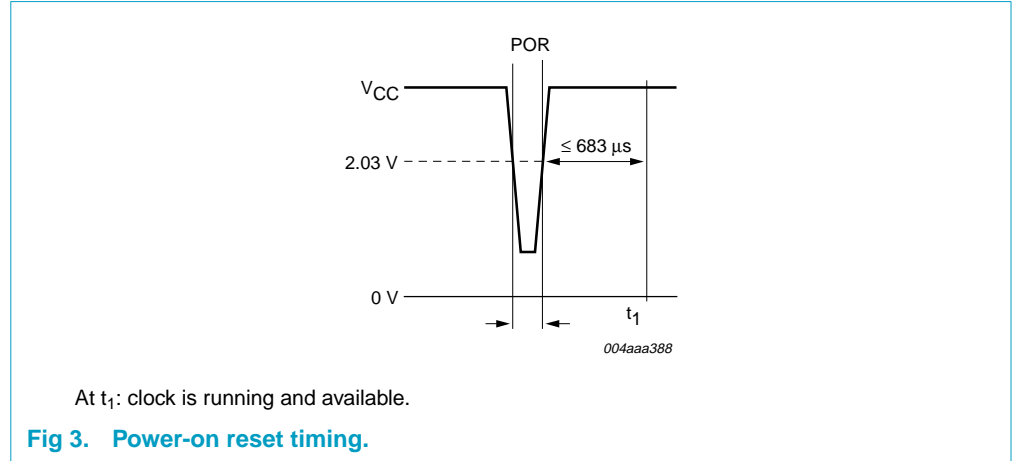

During enumeration, the LED blinks on momentarily. After successful configuration, the LED blinks off for 100 ms upon each transaction.

This feature provides a user-friendly indication of the status of the hub, the connected downstream devices and the USB traffic. It is a useful diagnostics tool to isolate faulty USB equipment and helps to reduce field support and hotline costs.

8.7 Power-on reset

The ISP1520 has an internal Power-On Reset (POR) circuit.

The triggering voltage of the POR circuit is 2.03 V nominal. A POR is automatically generated when V_{CC} goes below the trigger voltage for a duration longer than 1 μ s.

9. Configuration selections

The ISP1520 is configured through I/O pins and, optionally, through an external I²C-bus, in which case the hub can update its configuration descriptors as a master or as a slave.

Table 3 shows the configuration parameters.

Table 3: Configuration parameters

Mode and selection	Option	Configuration method			
		Pin control		Software control	
		Control pin	Reference	Affected field	Reference
Number of downstream facing ports	2 ports 3 ports 4 ports	DM1/DP1 to DM4/DP4	see Section 9.1.1	bNbrPorts0	see Table 22
Power switching mode	ganged multiple ganged ^[1] individual	PSW1_N to PSW4_N	see Section 9.1.2	wHubCharacteristics: bits D1 and D0 bPwrOn2PwrGood: time interval	see Table 22
Overcurrent protection mode	none global ^[2] multiple ganged individual	NOOC and OC1_N to OC4_N	see Section 9.1.3	wHubCharacteristics: bits D4 and D3	see Table 22
Non-removable ports	any port can be non-removable	AMBn_N	see Section 9.1.4	wHubCharacteristics: bit D2 (compound hub) DeviceRemovable: bit map	see Table 22
Port indicator support	no yes	all GRNn_N	see Section 9.1.5	wHubCharacteristics: bit D7	see Table 22

[1] Multiple ganged power mode is reported as individual power mode; refer to the USB 2.0 specification.

[2] When the hub uses the global overcurrent protection mode, the overcurrent indication is through the wHubStatus field bit 1 (overcurrent) and the corresponding change bit (overcurrent change).

9.1 Configuration through I/O pins

9.1.1 Number of downstream facing ports

To discount a physical downstream facing port, connect pins DP and DM of that downstream facing port to V_{CC} (3.3 V) starting from the highest port number (4).

The sum of physical ports configured is reflected in the bNbrPorts field.

Table 4: Downstream facing port number pin configuration

Number of physical downstream facing port	DM1/DP1	DM2/DP2	DM3/DP3	DM4/DP4
4	15 kΩ pull-down	15 kΩ pull-down	15 kΩ pull-down	15 kΩ pull-down
3	15 kΩ pull-down	15 kΩ pull-down	15 kΩ pull-down	V _{CC}
2	15 kΩ pull-down	15 kΩ pull-down	V _{CC}	V _{CC}

9.1.2 Power switching

Power switching of downstream ports can be done **individually** or **ganged**, where all ports are simultaneously switched with one power switch. The ISP1520 supports both modes, which can be selected using input PSWn_N; see Table 5.

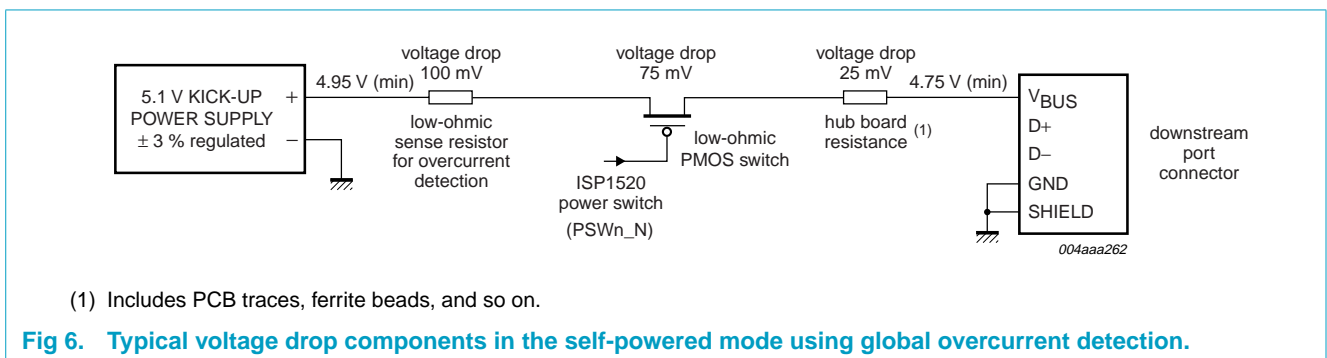

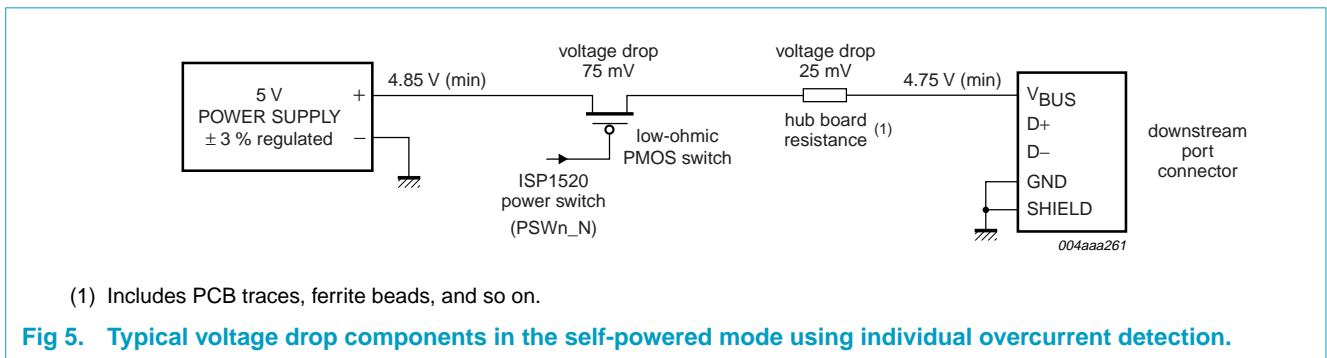

Voltage drop requirements: Self-powered hubs are required to provide a minimum of 4.75 V to its output port connectors at all legal load conditions. To comply with Underwriters Laboratory Inc. (UL) safety requirements, the power from any port must be limited to 25 W (5 A at 5 V). Overcurrent protection may be implemented on a global or individual basis.

Assuming a 5 V ± 3 % power supply, the worst-case supply voltage is 4.85 V. This only allows a voltage drop of 100 mV across the hub Printed-Circuit Board (PCB) to each downstream connector. This includes a voltage drop across the:

- Power supply connector
- Hub PCB (power and ground traces, ferrite beads)
- Power switch (FET on-resistance)
- Overcurrent sense device.

The PCB resistance and power supply connector resistance may cause a drop of 25 mV, leaving only 75 mV as the voltage drop allowed across the power switch and overcurrent sense device. The individual voltage drop components are shown in Figure 5.

For global overcurrent detection, an increased voltage drop is needed for the overcurrent sense device (in this case, a low-ohmic resistor). This can be realized by using a special power supply of 5.1 V ± 3 %, as shown in Figure 6.

PSWn_N pins have integrated weak pull-up resistors inside the chip.

Table 5: Power switching mode: pin configuration

Power switching mode	PSW1_N	PSW2_N	PSW3_N	PSW4_N
Ganged	internal pull-up	ground	ground	ground
Individual	internal pull-up	internal pull-up	internal pull-up	internal pull-up

9.1.3 Overcurrent protection mode

The ISP1520 supports all overcurrent protection modes: none, global and individual.

No overcurrent protection mode reporting is selected when pin NOOC = HIGH. Global and individual overcurrent protection modes are selected using pins PSWn_N, following the power switching modes selection scheme; see [Table 6](#).

For the global overcurrent protection mode, only PSW1_N and OC1_N are active; that is, in this mode, the remaining overcurrent indicator pins are disabled. To inhibit the analog overcurrent detection, the OC_N pins must be connected to $V_{REF(5V0)}$.

Table 6: Overcurrent protection mode pin configuration

Power switching mode	NOOC	PSW1_N	PSW2_N	PSW3_N	PSW4_N
None	HIGH	ground	ground	ground	ground
Global	LOW	internal pull-up	ground	ground	ground
Individual	LOW	internal pull-up	internal pull-up	internal pull-up	internal pull-up

Both analog and digital overcurrent modes are supported; see [Table 7](#).

For digital overcurrent detection, the normal digital TTL level is accepted on the overcurrent input pins. For analog overcurrent detection, the threshold is given in the DC characteristics. In this mode, to filter out false overcurrent conditions because of inrush and spikes, a dead time of 15 ms is built into the IC, that is, overcurrent must persist for 15 ms before it is reported to the host.

Table 7: Overcurrent detection mode selection pin configuration

Pin ADOC	Mode selection	Description
3.3 V or 5.0 V	analog	threshold ΔV_{trip}
Ground	digital	normal digital TTL level

9.1.4 Non-removable port

A non-removable port, by definition, is a port that is embedded inside the hub application box and is not externally accessible. The LED port indicators (pins AMBn_N) of such a port are not used. Therefore, the corresponding amber LED port indicators are disabled to signify that the port is non-removable; see [Table 8](#).

More than one non-removable port can be specified by appropriately connecting the corresponding amber LED indicators. At least one port should, however, be left as a removable port.

The detection of any non-removable port sets the hub descriptor into a compound hub.

Table 8: Non-removable port pin configuration

AMBn_N (n = 1 to 4)	Non-removable port
Ground	non-removable
Pull-up with amber LED	removable

9.1.5 Port indicator support

The port indicator support can be disabled by grounding all green port indicators (all pins GRNn_N); see Table 9. This is a global feature. It is not possible to disable port indicators for only one port.

Table 9: Port indicator support: pin configuration

GRN1_N to GRN4_N	Port indicator support
Ground	not supported
LED pull-up green LED for at least one port	supported

9.2 Device descriptors and string descriptors settings using I²C-bus

9.2.1 Background information on I²C-bus

The I²C-bus is suitable for bi-directional communication between ICs or modules. It consists of two bi-directional lines: SDA for data signals and SCL for clock signals. Both these lines must be connected to a positive supply voltage through a pull-up resistor.

The basic I²C-bus protocol is defined as:

- Data transfer is initiated only when the bus is not busy.
- Changes in the data line occur when the clock is LOW and must be stable when the clock is HIGH. Any changes in data lines when the clock is HIGH will be interpreted as control signals.

Different conditions on I²C-bus: The I²C-bus protocol defines the following conditions:

Not busy — both SDA and SCL remain HIGH

START — a HIGH-to-LOW transition on SDA, while SCL is HIGH

STOP — a LOW-to-HIGH transition on SDA, while SCL is HIGH

Data valid — after a START condition, data on SDA must be stable for the duration of the HIGH period of SCL.

Data transfer: The master initiates each data transfer using a START condition and terminates it by generating a STOP condition. To facilitate the next byte transfer, each byte of data must be acknowledged by the receiver. The acknowledgement is done by pulling the SDA line LOW on the ninth bit of the data. An extra clock pulse needs to be generated by the master to accommodate this bit.

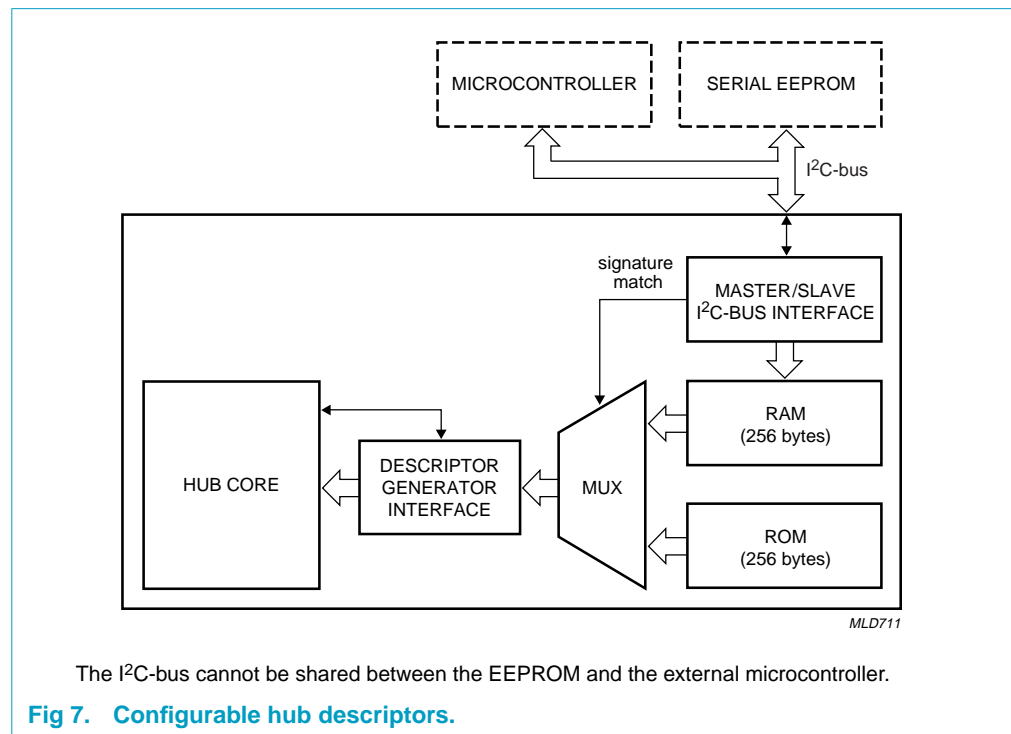

For more detailed information on the operation of the bus, refer to *The I²C-bus specification*.

I²C-bus address: The address of the ISP1520 is given in [Table 10](#).

Table 10: I²C-bus slave address

	MSB		Slave address					LSB		
Bit	A7	A6	A5	A4	A3	A2	A1		R/W	
Value	0	0	1	1	0	1	0		0/1	

9.2.2 Architecture of configurable hub descriptors

The configurable hub descriptors can be masked in the internal ROM memory; see [Figure 7](#). These descriptors can also be supplied from an external EEPROM or a microcontroller. The ISP1520 implements both the master and slave I²C-bus controllers. The information from the external EEPROM or the microcontroller is transferred into the internal RAM during the power-on reset. A signature word is used to identify correct descriptors. If the signature matches, the content of the RAM is chosen instead of the ROM.

When the external microcontroller mode is selected and while the external microcontroller is writing to the internal RAM, any request to configurable descriptors will be responded to with a Not Acknowledge (NAK). There is no specified time-out period for the NAK signal. This data is then passed to the host during the enumeration process.

The three configuration methods are selected by connecting pins SCL and SDA in the manner given in [Table 11](#).

Table 11: Configuration method

Configuration method	SCL	SDA
Internal ROM	ground	ground
External EEPROM	2.2 kΩ to 4.7 kΩ pull-up	2.2 kΩ to 4.7 kΩ pull-up
External microcontroller	driven LOW by the microcontroller during reset	2.2 kΩ to 4.7 kΩ pull-up

9.2.3 ROM or EEPROM map

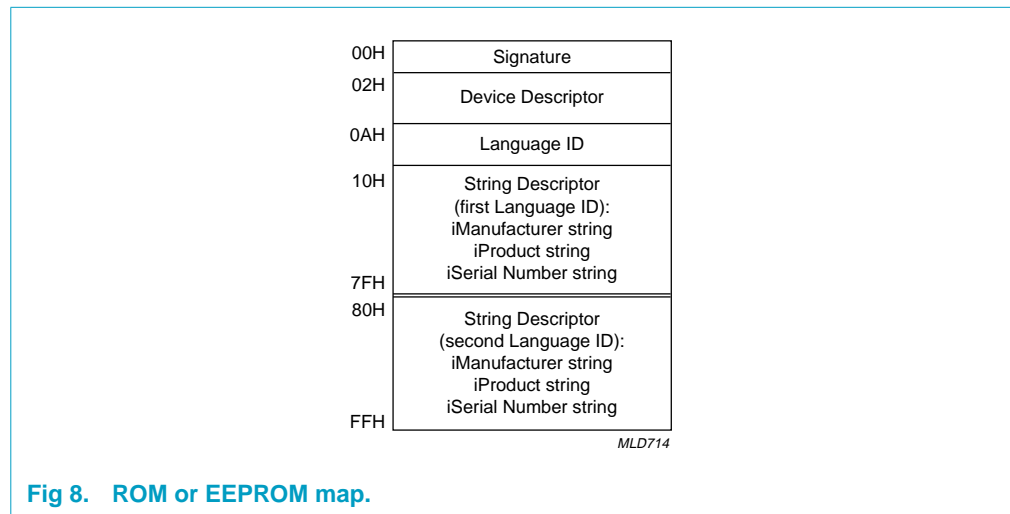

Fig 8. ROM or EEPROM map.

Remark: A 128-byte EEPROM supports one language ID only, and a 256-byte EEPROM supports two language IDs.

9.2.4 ROM or EEPROM detailed map

Table 12: ROM or EEPROM detailed map

Address (Hex)	Content	Default (Hex)	Example (Hex)	Comment
Signature descriptor				
00	signature (low)	55	-	signature to signify valid data comment
01	signature (high)	AA	-	
Device descriptor				
02	idVendor (low)	CC	-	Philips Semiconductors vendor ID

- [1] If this string descriptor is not supported, this bLength field must be programmed with the value 02H.
- [2] If this string descriptor is not supported, this bDescriptorType field must be used (programmed with any value, for example, 03H).
- [3] String descriptor index (iManufacturer) starts from the address 0EH for one language ID support and 10H for two languages ID support.

10. Hub controller description

Each USB device is composed of several independent logic endpoints. An endpoint acts as a terminus of communication flow between the host and the device. At design time, each endpoint is assigned a unique number (endpoint identifier; see [Table 13](#)). The combination of the device address (given by the host during enumeration), the endpoint number and the transfer direction allows each endpoint to be uniquely referenced.

The ISP1520 has two endpoints: endpoint 0 (control) and endpoint 1 (interrupt).

Table 13: Hub endpoints

Function	Endpoint identifier	Transfer type	Direction ^[1]	Maximum packet size (bytes)
Hub ports 0 to 4	0	control	OUT	64
			IN	64
	1	interrupt	IN	1

[1] IN: input for the USB host; OUT: output from the USB host.

10.1 Endpoint 0

According to the USB specification, all devices must implement a default control endpoint. This endpoint is used by the host to configure the USB device. It provides access to the device configuration and allows generic USB status and control access.

The ISP1520 supports the following descriptor information through its control endpoint 0:

- Device descriptor
- Device_qualifier descriptor
- Configuration descriptor
- Interface descriptor
- Endpoint descriptor
- Hub descriptor
- Other_speed_configuration descriptor.

The maximum packet size of this endpoint is 64 bytes.

10.2 Endpoint 1

Endpoint 1 can be accessed only after the hub has been configured by the host (by sending the Set Configuration command). It is used by the ISP1520 to send the status change information to the host.

Endpoint 1 is an interrupt endpoint. The host polls this endpoint once every 255 ms. After the hub is configured, an IN token is sent by the host to request the port change status. If the hub detects no change in the port status, it returns a NAK to this request, otherwise the Status Change byte is sent. [Table 14](#) shows the content of the change byte.

Table 14: Status Change byte: bit allocation

Bit	Name	Value	Description
0	Hub Status Change	0	no change in the hub status
		1	change in the hub status detected
1 to 4	Port n Status Change	0	no change in the status of port n (n = 1 to 4)
		1	change in the status of port n (n = 1 to 4)
5 to 7	-	-	not used

11. Descriptors

The ISP1520 hub controller supports the following standard USB descriptors:

- Device
- Device_qualifier
- Other_speed_configuration
- Configuration
- Interface
- Endpoint
- Hub.

The hub returns different descriptors based on the mode of operation: full-speed or high-speed.

Table 15: Device descriptor

Offset (bytes)	Field name	Value (Hex)		Comments
		Full-speed	High-speed	
0	bLength	12	12	descriptor length = 18 bytes

12. Hub requests

The hub must react to a variety of requests initiated by the host. Some requests are standard and are implemented by any USB device whereas others are hub-class specific requests.

12.1 Standard USB requests

Table 23 shows the supported standard USB requests.

Table 23: Standard USB requests

Request	bmRequestType byte 0 (bits 7 to 0)	bRequest byte 1 (hex)	wValue bytes 2, 3 (hex)	wIndex bytes 4, 5 (hex)	wLength bytes 6, 7 (hex)	Data response
Address						
Set Address	0000 0000	05	device address ^[1]	00, 00	00, 00	none
Configuration						
Get Configuration	1000 0000	08	00, 00	00, 00	01, 00	configuration value
Set Configuration (0)	0000 0000	09	00, 00	00, 00	00, 00	none
Set Configuration (1)	0000 0000	09	01, 00	00, 00	00, 00	none
Descriptors						
Get Configuration Descriptor	1000 0000	06	00, 02	00, 00	length ^[2]	configuration interface and endpoint descriptors
Get Device Descriptor	1000 0000	06	00, 01	00, 00	length ^[2]	device descriptor

12.3 Detailed responses to hub requests

12.3.1 Get configuration

This request returns the configuration value of the device. This request returns one byte of data; see Table 26.

Table 26: Get hub configuration response

Bit	Function	Value	Description
0	configuration value	0	device is not configured
		1	device is configured
1 to 7	reserved	0	-

12.3.2 Get device status

This request returns two bytes of data; see [Table 27](#).

Table 27: Get device status response

Bit	Function	Value	Description
0	self-powered	1	self-powered
1	remote wake-up	0	disabled
		1	enabled
2 to 15	reserved	0	-

12.3.3 Get interface status

The request returns two bytes of data; see [Table 28](#).

Table 28: Get interface status response

Bit	Function	Value	Description
0 to 15	reserved	0	-

12.3.4 Get endpoint status

The request returns two bytes of data; see [Table 29](#).

Table 29: Get endpoint status response

Bit	Function	Value	Description
0	halt	0	endpoint is not halted
		1	endpoint is halted
1 to 15	reserved	0	-

12.3.5 Get hub status

The request returns four bytes of data; see [Table 30](#).

Table 30: Get hub status response

Bit	Function	Value	Description
0	local power source	0	local power supply good
		1	local power supply lost (inactive)
1	overcurrent indicator	0	no overcurrent condition currently exists
		1	a hub overcurrent condition exists
2 to 15	reserved	0	-
16	local power status change	0	no change in the local power status
		1	local power status has changed

Table 30: Get hub status response...continued

Bit	Function	Value	Description
17	overcurrent indicator change	0	no change in overcurrent
		1	overcurrent status has changed
18 to 31	reserved	0	-

12.3.6 Get port status

This request returns four bytes of data. The first word contains the port status bits (wPortStatus), and the next word contains the port status change bits (wPortChange). The contents of wPortStatus is given in Table 31, and the contents of wPortChange is given in Table 32.

Table 31: Get port status response (wPortStatus)

Bit	Function	Value	Description
0	current connect status	0	no device is present
		1	a device is present on this port
1	port enabled or disabled	0	port is disabled
		1	port is enabled
2	suspend	0	port is not suspended
		1	port is suspended
3	overcurrent indicator	0	no overcurrent condition exists
		1	an overcurrent condition exists
4	reset	0	reset signaling is not asserted
		1	reset signaling is asserted
5 to 7	reserved	0	-
8	port power	0	port is in the powered-off state
		1	port is not in the powered-off state
9	low-speed device attached	0	full-speed or high-speed device is attached
		1	low-speed device is attached
10	high-speed device attached	0	full-speed device is attached
		1	high-speed device is attached
11	port test mode	0	not in the port test mode
		1	in the port test mode
12	port indicator control	0	displays default colors
		1	displays software controlled color
13 to 15	reserved	0	-

Table 32: Get port status change response (wPortChange)

Bit	Function	Value	Description
0	connect status change	0	no change in the current connect status
		1	change in the current connect status
1	port enable or disable change	0	port is enabled
		1	port is disabled

Table 32: Get port status change response (wPortChange)...*continued*

Bit	Function	Value	Description
2	suspend change	0	no change
		1	resume complete
3	overcurrent indicator change	0	no change in the overcurrent indicator
		1	change in the overcurrent indicator
4	reset change	0	no change
		1	reset complete
5 to 15	reserved	0	-

12.4 Various get descriptors

bmRequestType — 10000000B

bmRequest — GET_DESCRIPTOR = 6

Table 33: Get descriptor request

Request name	wValue		wIndex	Data
	Descriptor index	Descriptor type	Zero/Language ID	
Get device descriptor	00	01	0	device descriptor
Get configuration descriptor	00	02	0	configuration interface and endpoint descriptors
Get language ID string descriptor	00	03	0	language ID support string
Get manufacturer string descriptor	01	03	n	manufacturer string in LANGID n
Get product string descriptor	02	03	n	product string in LANGID n
Get serial number string descriptor	03	03	n	serial number string in LANGID n

13. Limiting values

Table 34: Absolute maximum ratings

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	supply voltage 3.3 V		-0.5	+4.6	V
$V_{REF(5V0)}$	input reference voltage 5.0 V		-0.5	+6.0	V
$V_{I(5V0)}$	input voltage on 5 V buffers	$3.0\text{ V} < V_{CC} < 3.6\text{ V}$	[1] -0.5	+6.0	V
$V_{I(3V3)}$	input voltage on 3.3 V buffers	$3.0\text{ V} < V_{CC} < 3.6\text{ V}$	-0.5	+4.6	V
$V_{O(3V3)}$	output voltage on 3.3 V buffers		-0.5	+4.6	V
I_{lu}	latch-up current	$V_I < 0$ or $V_I > V_{CC}$	-	100	mA
V_{esd}	electrostatic discharge voltage	on pins DM1 to DM4, DP1 to DP4, OC1_N to OC4_N, and all $V_{REF(5V0)}$ and GND pins; $I_{LI} < 1\text{ }\mu\text{A}$	[2][3] -4000	+4000	V
		on all other pins; $I_{LI} < 1\text{ }\mu\text{A}$	[2][3] -2000	+2000	V
T_{stg}	storage temperature		-40	+125	°C

[1] Valid only when supply voltage is present.

[2] Test method available on request.

[3] Equivalent to discharging a 100 pF capacitor via a 1.5 k Ω resistor (Human Body Model).

14. Recommended operating conditions

Table 35: Recommended operating ranges

Symbol	Parameter	Min	Typ	Max	Unit
V_{CC}	supply voltage 3.3 V	3.0	3.3	3.6	V
$V_{REF(5V0)}$	input reference voltage 5.0 V	[1] 4.5	5.0	5.5	V
$V_{I(3V3)}$	input voltage on 3.3 V pins	0	-	V_{CC}	V
$V_{I(5V0)}$	input voltage on 5 V tolerant pins	0	-	$V_{REF(5V0)}$	V
T_{amb}	ambient temperature	-40	-	+70	°C

[1] All internal pull-up resistors are connected to this voltage.

15. Static characteristics

Table 36: Static characteristics: supply pins

$V_{CC} = 3.0\text{ V to }3.6\text{ V}$; $T_{amb} = -40\text{ }^{\circ}\text{C to }+70\text{ }^{\circ}\text{C}$; unless otherwise specified.

[1] $f_{SCL} = \frac{1}{64} \times f_{XTAL}$.

[2] Rise time is determined by C_b and pull-up resistor value R_p (typical 4.7 k Ω).

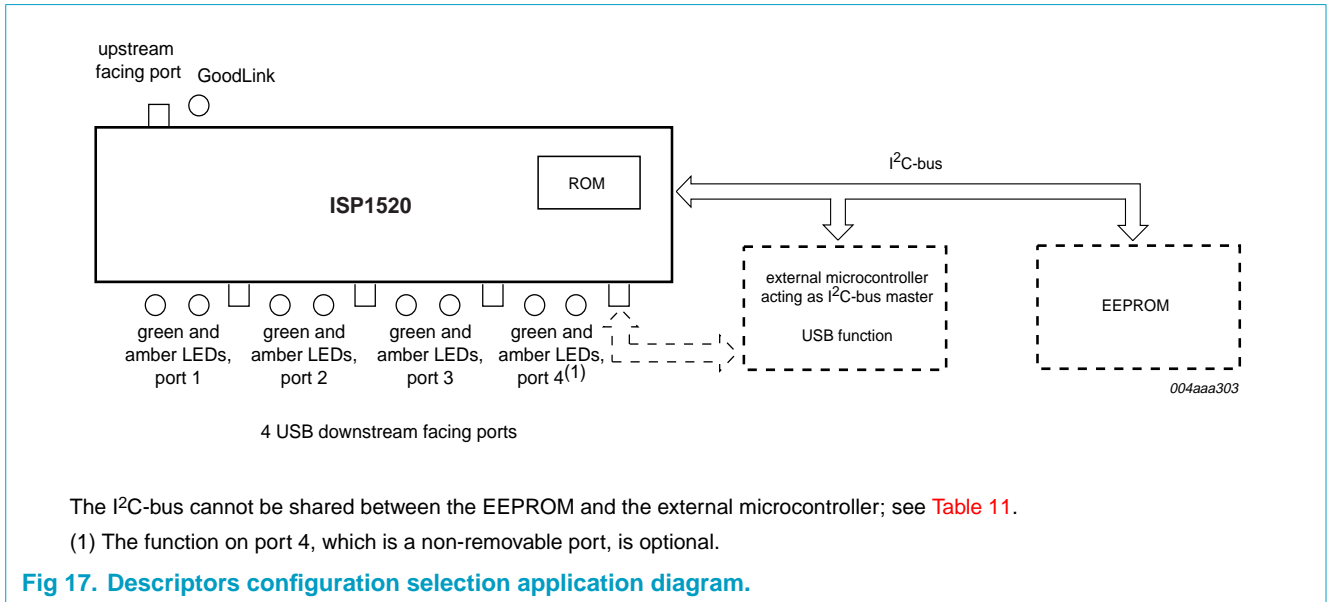

Fig 16. I²C-bus timing.

17. Application information

17.1 Descriptor configuration selection

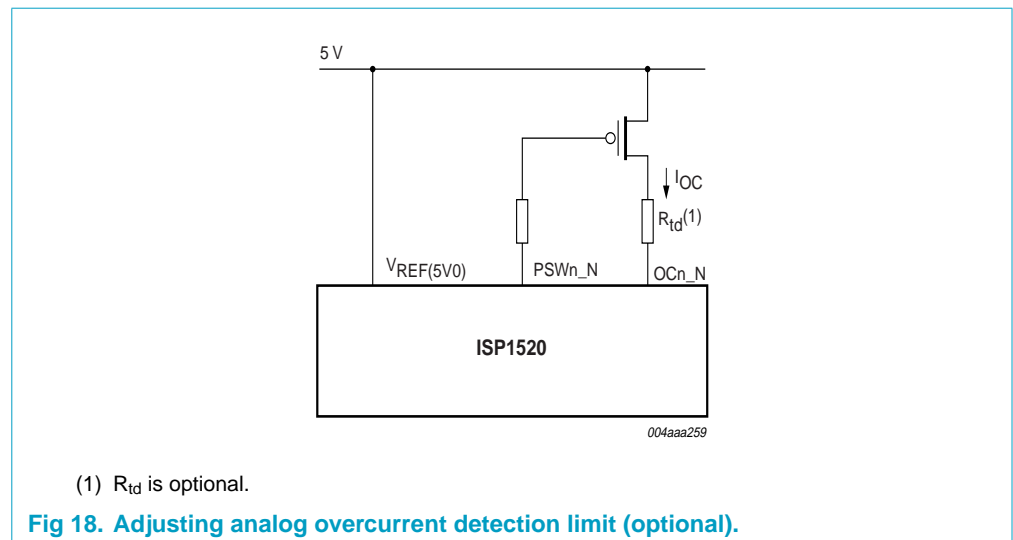

17.2 Overcurrent detection limit adjustment

For an overcurrent limit of 500 mA per port, a PMOS with R_{DS(on)} of approximately 100 mΩ is required. If a PMOS with a lower R_{DS(on)} is used, analog overcurrent detection can be adjusted by using a series resistor; see [Figure 18](#).

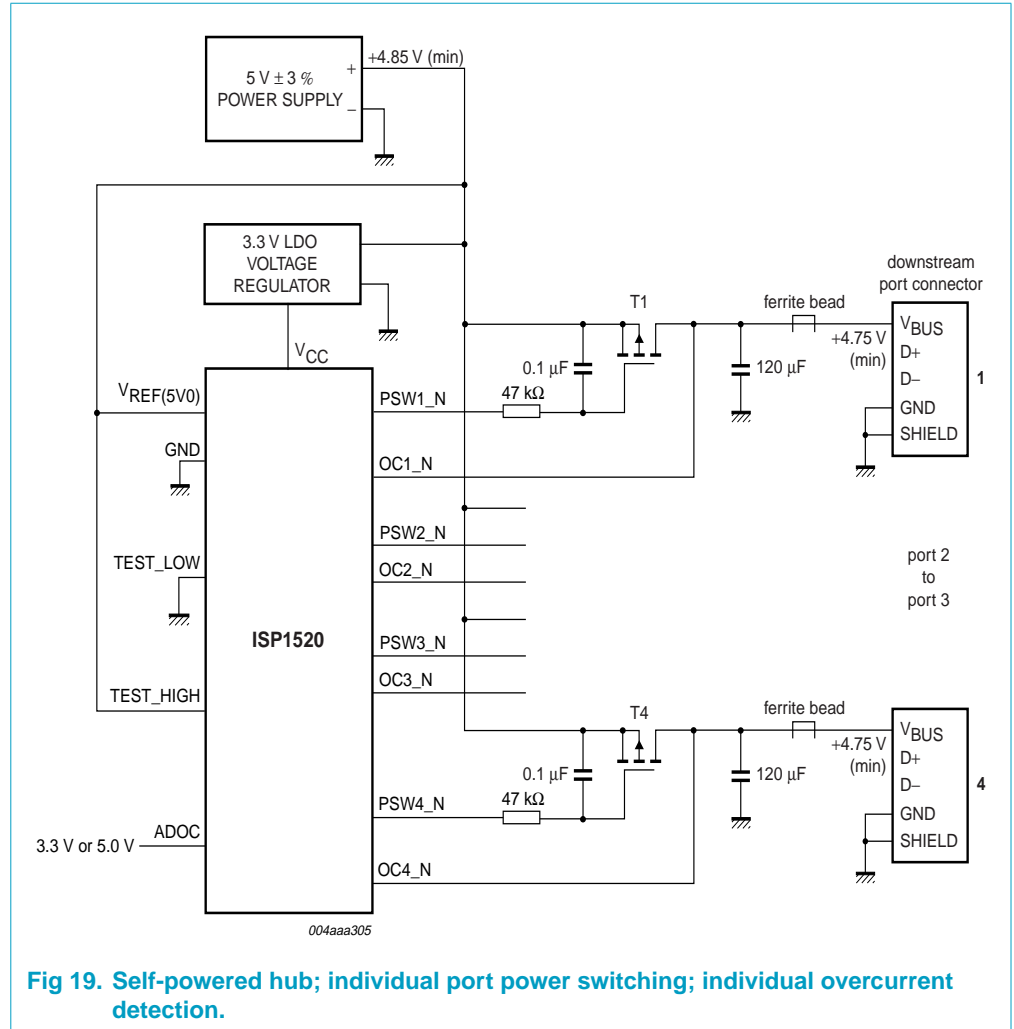

$$\Delta V_{\text{PMOS}} = \Delta V_{\text{trip}} = \Delta V_{\text{trip}(\text{intrinsic})} - (I_{\text{OC}(\text{nom})} \times R_{\text{td}}), \text{ where:}$$

$$\Delta V_{\text{PMOS}} = \text{voltage drop on PMOS}$$

$$I_{\text{OC}(\text{nom})} = 0.6 \mu\text{A}.$$

20. Soldering

20.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended. In these situations reflow soldering is recommended.

20.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON..T and SSOP..T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

20.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.

- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

20.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

20.5 Package related soldering information

Table 47: Suitability of surface mount IC packages for wave and reflow soldering methods

Package ^[1]	Soldering method	
	Wave	Reflow ^[2]
BGA, HTSSON..T ^[3] , LBGA, LFBGA, SQFP, SSOP..T ^[3] , TFBGA, USON, VFBGA	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ^[4]	suitable
PLCC ^[5] , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ^{[5][6]}	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ^[7]	suitable
CWQCCN..L ^[8] , PMFP ^[9] , WQCCN..L ^[8]	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note* (AN01026); order a copy from your Philips Semiconductors sales office.

[2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.

- [3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ °C} \pm 10\text{ °C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- [4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- [5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- [6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- [7] Wave soldering is suitable for SSOP, TSSOP, VSO and VSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- [8] Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- [9] Hot bar soldering or manual soldering is suitable for PMFP packages.

21. Revision history

22. Data sheet status

Level	Data sheet status ^[1]	Product status ^{[2][3]}	Definition
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

[1] Please consult the most recently issued data sheet before initiating or completing a design.

[2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.

[3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

23. Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

24. Disclaimers

Life support — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or

performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

25. Licenses

Purchase of Philips I²C components

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.

26. Trademarks

ACPI — is an open industry specification for PC power management, co-developed by Intel Corp., Microsoft Corp. and Toshiba.

GoodLink — is a trademark of Koninklijke Philips Electronics N.V.

I²C-bus — is a trademark of Koninklijke Philips Electronics N.V.

OnNow — is a trademark of Microsoft Corporation.

Intel — is a registered trademark of Intel Corporation.
